SUMMARY

Applied AI engineer and founder who has built document-processing, computer-vision, agent-evaluation, and business-automation systems. Strongest at turning an unclear problem into a testable workflow, finding where it fails, and carrying the result into production.

TECHNICAL SKILLS

Machine Learning: LLM document extraction, model training and evaluation, experiment design, error analysis, data leakage, train/serve parity, NLP, computer vision, gradient-boosted trees, CLIP

Frameworks: PyTorch, TensorFlow, scikit-learn, LightGBM

Software & Systems: Python, C++, JavaScript, TypeScript, Scala, Java, agent-assisted automation, API integrations, data workflows, inference, testing, CI/CD

SELECTED TECHNICAL PROJECTS

Mendmark — Mutation Testing for Agent Evals

GitHub · 2026

- Built an open-source Python tool that plants controlled failures in passing agent traces, reruns a team's DeepEval metrics, and fails CI when those evals miss wrong tool arguments, repeated side effects, hidden tool errors, or damaged responses.
- Added per-tool mutation coverage, tool-schema and contract checks, privacy-safe reports, and regression gates that show when an evaluator stops catching a fault it caught before.

lgbm-to-code — Cross-Runtime ML Inference

GitHub · PyPI

- Built a code generator that turns trained, one-output LightGBM models into dependency-free Python, C++17, or JavaScript raw-score inference.
- Added executed and compiled parity tests across all three runtimes at 1e-12 tolerances, including missing-value routing and explicit rejection of unsupported model types.

PROFESSIONAL EXPERIENCE

SyncABill — Founder & Applied AI Engineer

2025–Present

- Built and deployed an invoice workflow that uses Gemini to extract structured data from emailed and uploaded documents, then sends approved bills to QuickBooks Online or Xero.
- Designed deterministic checks for tenancy, file validity, duplicates, plan usage, invoice arithmetic, configurable human review, ledger accounts, retries, and audit history.
- Completed Google's CASA Tier 2 security assessment and brought the product to SOC 2 readiness.

Casabauhaus — Founder & Operator

2022–Present

- Operate a vintage-furniture business spanning sourcing, pricing, merchandising, sales, and delivery, supported by agent and API workflows for reporting, social media, seasonality analysis, and Shopify.
- Developed furniture-valuation and mid-century classification models used in sourcing decisions, including a fine-tuned CLIP model built before modern vision-language models were widely practical.

Perfsy — Founder & Machine Learning Engineer

2021–2022

- Built a computer-vision pipeline to extract structured fields from scanned DMV vehicle titles.
- Normalized scan orientation with OpenCV and experimented with character primitives, autoencoders, convolutional features, and DNN classifiers.
- Created data and evaluation workflows to inspect recognition failures and improve the pipeline.

EDUCATION

University of California, San Diego

Major: Condensed Matter Physics | approximately three years, degree not completed
